

OptiPhoenix

Client Survey Tool — **Product Guide**

Design a survey, send it to a client through one private link, and watch the feedback roll in — then let AI turn it into a plain-English summary. This guide walks through what the product does and how to give a confident demo.

For delivery & account teams

No client logins

Charts + AI summary

OVERVIEW

What is OptiPhoenix?

OptiPhoenix is a workspace for teams that need **structured feedback from their clients**. Instead of emailing spreadsheets or juggling generic form tools, a team builds a survey once, attaches it to a specific client, and shares a single secure link. Every answer lands in one place — ready to filter, export, chart, and summarise.

Three kinds of people use it

Admin

Approves new sign-ups, manages every user and team, and sees the whole organisation from the dashboard.

Team Lead

Builds forms, manages their own clients, sends surveys, and reads the responses, insights, and AI summaries.

Client

Opens their private link and fills in the survey. **No account, no password** — just the questions.

Every client gets their **own unique URL**. Links are not shared or reused, so responses are always tied to the right client.

What a team gets out of it

One tidy response table

Sortable, filterable, and exportable to Excel or PDF.

Insights

Score breakdowns and charts per client and time period.

AI summary

A short narrative of what clients are actually saying — one click.

Templates

Save a good form once and reuse it every quarter.

The journey, end to end

From a new sign-up to a finished summary, here is the whole path:

1

Sign up & get approved

A new user registers and waits on the Admin's approval screen. The Admin clicks approve.

2

Set up a team & add clients

A Team Lead creates a team, invites teammates if needed, and adds the client organisations they work with.

3

Build the form

In the visual builder, drag in questions, group them into sections, and add branching logic. Start blank or from a template.

4

Publish & attach a client

Publishing turns the form into a live survey and generates that client's private link.

5

The client responds

The client opens their link, answers the questions, and submits — no login anywhere.

6

Read, chart, and summarise

Responses appear instantly in the table. Insights builds the charts; the AI summary writes the recap.

CONCEPTS

A survey has three states

Forms, teams, clients, and templates all live in the sidebar, each with its own dedicated screen. The dashboard pulls the highlights together.

Question types you can add

The builder ships with thirteen field types, so most feedback forms can be built without compromise:

Short text

Long text

Single choice

Multiple choice

Dropdown

Branching dropdown

Rating

Resource rating

Yes / No

Comment

Suggestion

Date

Time

Access levels within a team

LEVEL	CAN DO
View	See the team's clients, forms, and responses — read only.
Write	Everything in View, plus create and edit clients and forms.
Full access	Everything in Write, plus manage members and team settings.

What each screen is for

Dashboard

Role-aware landing page: headline numbers, a 30-day response trend, recent activity, and quick actions. Admins also see a teams overview.

Form builder

Drag-and-drop canvas. Add questions and sections, set required fields, and route respondents with branching logic. Save as a template anytime.

The Responses screen displays a table with three columns: CLIENT, FORM, and SCORE. The table lists three entries: Acme Co (Q3 Feedback, 4.6), Globex (Q3 Feedback, 3.9), and Initech (Onboarding, 4.2). Below the table, there are links to 'Export Excel' and 'Export PDF'.

CLIENT	FORM	SCORE
Acme Co	Q3 Feedback	4.6
Globex	Q3 Feedback	3.9
Initech	Onboarding	4.2

↓ Export Excel · ↓ Export PDF

Responses

Every submission in one table — filter by client, form, or period, open a single response in detail, or export the lot.

Insights & AI summary

Insights charts the scores over time and by client. The AI summary reads the raw answers and writes a short, shareable recap.

A 5-minute demo script

- 1 Sign in as **Team Lead** (**lead@optiphoenix.local** / **Lead123!**). Point out the **dashboard** — KPIs, the response trend, recent activity.
- 2 Open **Teams** → **Clients**. Show an existing client, then add a new one to prove how quick it is.
- 3 Go to **Forms** → **New form**. Drag in a **Rating** question and a **Long text** question. Group them in a section.
- 4 Attach the client and hit **Publish**. Copy the generated **private link**.
- 5 Open the link in a fresh tab (or incognito) — **no login**. Fill it in as the client and submit.
- 6 Back in the app, open **Responses**: the new submission is already there. Open it in detail; export to Excel.
- 7 Open **Insights** to show the chart update, then **AI Summary** → **Generate** for the plain-English recap.
- 8 Finally, sign in as **Admin** (**admin@optiphoenix.local** / **Admin123!**) and show **Users** — the approval queue and the org-wide dashboard.

Getting it running locally

STEP	COMMAND
Install	<code>npm install</code>
Configure	<code>cp .env.example .env</code> — then set <code>DATABASE_URL</code> and <code>AUTH_SECRET</code>
Create tables	<code>npm run db:migrate</code>
Load demo data	<code>npm run db:seed</code>
Start	<code>npm run dev</code> → open localhost:3000

MySQL setup for Mac (XAMPP / MAMP, no Xcode) is in **docs/MYSQL_SETUP.md**. The AI summary needs a free **GEMINI_API_KEY**; email needs a **RESEND_API_KEY**. Both are optional for a basic demo.
